Embedded Robotics

Mobile Robot Design and Applications with Embedded Systems

This book presents a unique combination of mobile robots and embedded systems, from introductory to intermediate level. It is structured in three parts, dealing with embedded systems (hardware and software design, actuators, sensors, PID control, multitasking, wireless communication), mobile robot design (driving, balancing, walking, and flying robots), and mobile robot applications (mapping, robot soccer, genetic algorithms, neural networks, behavior-based systems, and simulation). Its third edition has been significantly extended with new chapters on CPUs, robot manipulators and automotive systems, as well as additional material in the chapters on navigation/localization, neural networks and genetic algorithms. This results in a much more complete treatment of the subject area and an even more well-rounded publication that contains up-to-date research results. The book is written as a text for courses in computer science, computer engineering, IT, electronic engineering, and mechatronics, as well as a guide for robot hobbyists and researchers.... *more on http://springer.com/978-3-540-70533-8*

► From introductory to intermediate level ► Covers in-depth embedded micro-controller systems, sensors, actuators (DC motors), PID control, mobile robot design, and mobile robot applications ► Layout with icons per chapter, side texts, and many figures, photographs and worked-example programs ► Internet support at http://robotics.ee.uwa.edu.au/eyebot/ with free download of: RoBIOS operating system, example programs, online documentations, simulator ► Lecture notes (PowerPoint) available for lecturers who adopt the book for a course
